

I don't have a lot of skill with Android, or a lot of time to develop something amazing, so I'm just going to do a simple calculation app. Keeping in line with my overall mobile development oeuvre, I'll be doing a BMI calculator, that is to say, Bacon Mass Index.

The app will simply calculate the users body mass index based on height and weight, then, based on the number, the app will recommend how much more/less bacon the user should eat per day.

Height

Weight

Height

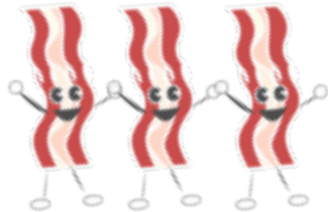

72"

Weight

160 lbs

Your BMI:

21.7

You could be eating 3 more
piece of bacon per day!
